Measurement Characteristics and Clinical Utility of the Parkinson Disease Quality of Life Measure (39- and 8-item versions) in Individuals With Parkinson Disease

Deborah Kegelmeyer, PT, DPT, MS, GCS (chair PD EDGE Task Force), and the PD EDGE Task Force, Terry Ellis, PT, PhD, NCS, Alicia Esposito, PT, DPT, NCS, Rosemary Gallagher, PT, DPT, GCS PhD(c), Cathy C. Harro, MS, PT, NCS, Jeffrey Hoder, PT, DPT, NCS, Erin Hussey, DPT, MS, NCS, Suzanne O’Neal, PT, DPT, NCS

The Parkinson’s Disease Quality of Life questionnaire is a self-report instrument used to assess health-related quality of life in individuals with Parkinson disease (PD). The instrument assesses quality of life across 8 domains: mobility, activities of daily living, emotional well-being, stigma, social support, cognitive impairment, communication, and bodily discomfort. There are extensive psychometric data available for this measure, the majority of which reveal adequate to excellent validity and reliability for both the 39-item Parkinson’s Disease Questionnaire (PDQ-39) summary index score and the majority of the 8 domain scores (with the notable exception of the social support domain). Domain scores are associated with larger floor and ceiling effects compared with the PDQ-39 summary index score, suggesting caution in the interpretation of individual domain scores. Responsiveness of the summary index score has been demonstrated with natural disease progression and with pharmacological interventions with mixed results following rehabilitation interventions. The use of the PDQ-39 is recommended for persons in Hoehn and Yahr stages 1 to 5. As the time required to administer the PDQ-39 (10–15min) can be long, an abbreviated 8-item version (PDQ-8) was developed.

The PDQ-8 is a quick (<5min), valid, and reliable self-report instrument with adequate to excellent psychometric data supporting its use in persons with PD. It consists of 1 item from each of the 8 dimensions in the original PDQ-39. It is responsive to changes in health-related quality of life with natural disease progression and with pharmacological interventions, particularly in the later Hoehn and Yahr stages. However, responsiveness to rehabilitation interventions has not been adequately assessed. The PDQ-8 has no ceiling/floor effects and is adequately correlated with Hoehn and Yahr stages, Unified Parkinson’s Disease Rating Scale scores, and disease duration. This Rehabilitation Measures Database summary provides a review of the psychometric properties of the PDQ-39 and PDQ-8 in individuals living with PD. A full review of the PDQ-39 and PDQ-8 as well as reviews of more than 100 other instruments can be found at www.rehabmeasures.org.

### Parkinson’s Disease Questionnaire

**Measure Name:** Parkinson’s Disease Questionnaire  
**Acronym:** PDQ-8, PDQ-39  
**Summary Authors:** Kegelmeyer D, Ellis T, Esposito A, Gallagher R, Harro C, Hoder J, Hussey E, O’Neal S

**Population Reviewed:** Parkinson’s Disease, others at www.rehabmeasures.org

**Admin Time:** 10-20 minutes  
**Items:** 8 or 39  
**Score:** 0/100 (min./max.)

**Purpose and Administration Instructions:**
- Measure quality of life in person’s with Parkinson’s Disease (PD)

**Required Equipment:** Paper copy of PDQ-8 or PDQ-39 and pen  
**Training:** None required

**Validity:**
- **Convergent Validity:**
  - Excellent when using a proxy  
  - Adequate for the Columbia Rating Scale, long disease duration, and higher H&Y stage

**Reliability:**
- **PDQ-8:**
  - Adequate test-retest reliability  
  - Excellent interrater reliability and internal consistency

**PDQ-39:**
- Excellent test-retest reliability
- Adequate interrater reliability for all subscales but Stigma, Cognition, and Communication, which had poor interrater reliability
- Excellent internal consistency

**Score Interpretation:** Lower score reflects better quality of life

**MDC:** PDQ-39: MDC ranged from 12-24-24.48 for each dimension

**Considerations:**
- Many studies only report the mean H&Y stage, making classifying evidence by stage alone difficult. The majority of evidence supporting the use of the PDQ-8 is for persons in H&Y stages 2-3.
- PDQ-39 may be less suitable to use in earlier H&Y stages of PD, as indicated by large ceiling effects in mildly perceived PD and bias toward the more severe end of health impairments.
